TASKS

1. Write shell script that reads 2 integer values from user and print their sum on screen.

```
student@student-virtual-machine:~$ pico sum
student@student-virtual-machine:~$ cat sum
#!/bin/bash

echo "Enter first integer:"
read a

echo "Enter second integer:"
read b

sum=$((a + b))

echo "Sum is: $sum"

student@student-virtual-machine:~$ chmod u+x sum
student@student-virtual-machine:~$ ./sum
Enter first integer:
3
Enter second integer:
9
Sum is: 12
```

2. Write shell script that defines 2 integers and one float value like

a=5

b=7

c=5.5

Perform multiplication of integers then divide with float.

and finally print result with four decimal places like 6.3636

You have to use pipe operator (|) to send variables to **bc** utility for arithmetic.

```
student@student-virtual-machine:~$ pico float
student@student-virtual-machine:~$ cat float
#!/bin/bash

a=5
b=7
c=5.5

# Perform (a * b) / c with 4 decimal places
result=$(echo "scale=4; ($a * $b) / $c" | bc)

echo "Result is: $result"
student@student-virtual-machine:~$ chmod u+x float
student@student-virtual-machine:~$ ./float
Result is: 6.3636
```
